Delivery Manager – AI Projects

Fill these in before posting: location · salary range · benefits · work mode · application email. Everything else is ready to copy and paste.

Location: [Tiruchirappalli, Tamil Nadu / Hybrid] **Experience:** 4–8 years **Employment type:** Full-time, permanent **Salary:** [₹XX–XX LPA + performance-linked variable]

About Adople AI

Adople AI builds production AI systems for enterprise clients in healthcare and financial services — agentic document extraction, AI data analysts, voice agents and enterprise AI workflows. We work on real deployments in regulated environments, not proofs of concept.

The role

We are looking for a Delivery Manager who is accountable for work getting **finished** — not for producing plans and status reports.

You will own delivery across our client engagements: breaking work down, assigning it clearly, tracking it honestly, and giving clients dates we can actually meet. If you enjoy removing friction more than adding process, you will do well here.

What you'll do

Own end-to-end delivery of AI projects for enterprise clients, from kickoff to handover
Break work into clearly assignable tasks — one owner, one date, and acceptance criteria anyone can verify
Run the delivery board day to day: track work in progress, cycle time, blockers and aging items
Produce estimates you can defend, with ranges and confidence levels rather than single-number guesses
Manage client-side dependencies (sample data, SME availability, security reviews, sign-offs) as first-class items in the plan, with named owners and dates
Escalate on a fixed schedule rather than on instinct, so nothing sits stuck for days unnoticed
Run reviews, retrospectives and post-mortems that produce a small number of changes that actually happen
Own and configure our delivery tooling (Jira, Linear or similar), keeping it simple rather than adding to it
Communicate with clients early, specifically and honestly — especially when a date is at risk
Continuously remove steps, meetings and approvals that no longer earn their place

What success looks like

First 30 days: every active item has an owner, a deadline and written acceptance criteria; baseline delivery metrics published
By 90 days: measurably faster delivery cycles, 80%+ of commitments met on time, and no client surprised by a missed date
By 6 months: estimates calibrated against actuals, and a delivery process that is smaller than the one you inherited

What you need

4–8 years in project or delivery management for software, data or AI projects, including at least 2 years personally accountable for client-facing deadlines
Strong grasp of estimation and scheduling: decomposition, effort versus calendar time, dependency and risk management
Technical literacy — able to read an API spec, a data pipeline design or a model evaluation report and ask the right follow-up questions. You do not need to write code, but you cannot be bluffed
Hands-on experience with Jira, Linear, Asana or similar, including configuration and reporting
Excellent written English. Most of this role is writing clearly enough that no follow-up conversation is needed
Comfortable pushing back on scope — with a reason and an alternative, not just a refusal
Willing to overlap with US time zones for part of the working week

Good to have

Domain exposure to healthcare (HIPAA, HL7/FHIR, revenue cycle management) or financial services (KYC/AML, regulatory reporting)
Experience delivering LLM or ML-based systems, including evaluation design and QA of non-deterministic output
Agency or services background running several concurrent client engagements
Familiarity with Agile, Kanban, WIP limits, or Lean delivery practices
PMP, CSM or PMI-ACP certification (useful, not a substitute for delivery track record)

What we offer

Real ownership of delivery across our client portfolio, with the authority to make decisions
Production AI work in regulated, high-value domains rather than pilots that go nowhere
A small team with short decision paths and no layers to route through
[Salary range] plus performance-linked variable pay
[Health insurance / other benefits]
[Hybrid / remote / on-site] working arrangement

How to apply

Apply through this portal with your CV.

In your application, please include a short note (a few lines is enough) about **one project you ran that slipped** — what caused it, and what you changed afterwards. We are far more interested in the diagnosis than in the outcome.

Copy these into the structured fields when posting.

Key skills Project Management, Delivery Management, Agile, Scrum, Kanban, Jira, Stakeholder Management, Client Management, Project Planning, Estimation, Risk Management, Sprint Planning, Cross-functional Team Management, AI/ML Project Delivery, Software Project Management, Program Management

Field values

Field	Value
Role	Project Manager / Delivery Manager
Role category	Technology / IT — Project & Program Management
Industry type	IT Services & Consulting / Artificial Intelligence
Functional area	Project & Program Management
Employment type	Full Time, Permanent
Education	Any graduate; B.E./B.Tech or Computer Science preferred
Experience	4–8 years
Openings	1

Notes for posting

Title. "Delivery Manager – AI Projects" is the recommended posting title because candidates search for "Delivery Manager" and "Project Manager". Do not post it as "Task Completion Manager" — it reads junior and

returns almost no search traffic. Good alternatives, depending on how you want it to land:

Technical Project Manager – AI Delivery
Project Manager – AI & Data Projects
Senior Delivery Manager – AI Solutions

Per-portal adjustments.

Naukri: keep the description under roughly 5,000 characters. If you need to trim, cut "What success looks like" and shorten "Good to have" — the key-skills field does most of the matching work here, so make sure it is complete.
LinkedIn: post as written. The "What success looks like" section performs well with senior candidates and is worth keeping.
Indeed: move "How to apply" to the very top; Indeed applicants often skim only the first screen.

One thing to decide before you post. This role only works if the person has real authority. Confirm internally that they can reject an incoming request, enforce a work-in-progress limit against an engineer's objection, and change tool configuration without seeking approval. If not, you are hiring a coordinator — reword the responsibilities accordingly, or strong candidates will find the gap in interview and withdraw.
